

Sterillium®

Care – where others only disinfect

Sterillium®: not only gentle on the skin, but with active skincare effect

A hand disinfectant's skin tolerability makes an essential contribution to the employees' acceptance and thus to compliance. A recent study shows that Sterillium® classic pure* is capable of even more.

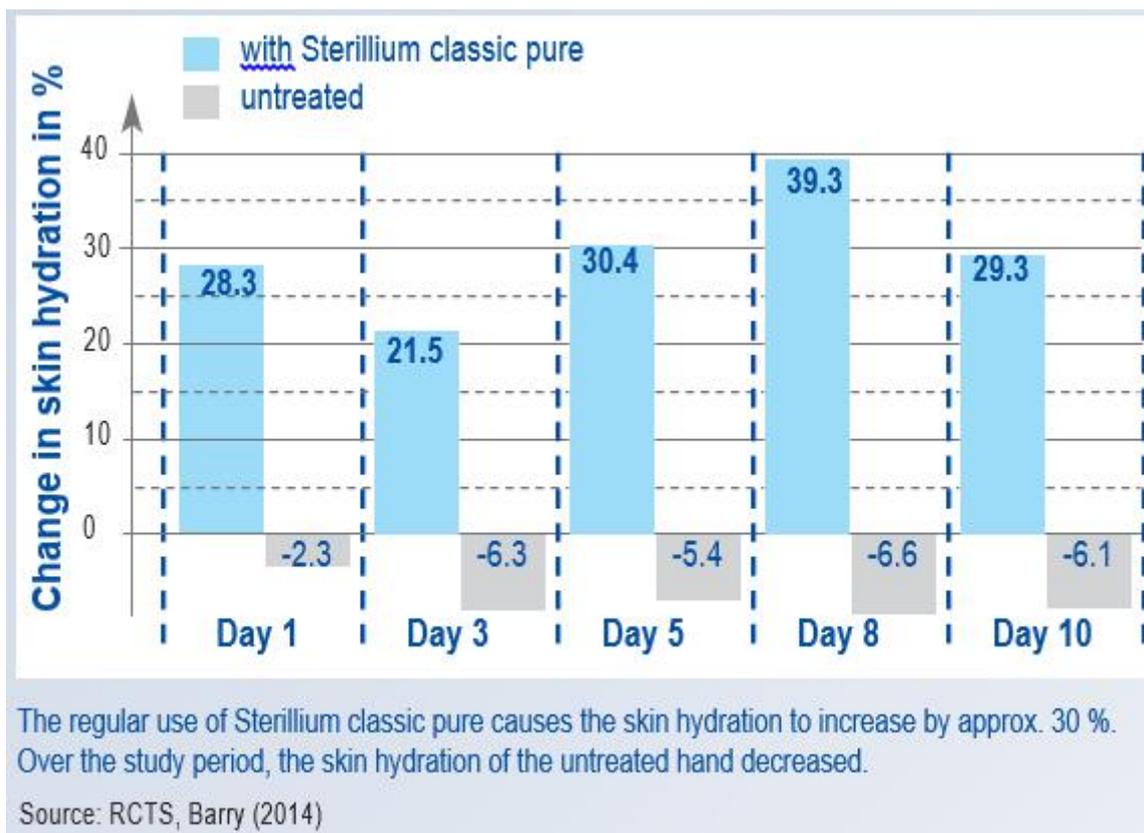

Tested under practical conditions

With a total of 300 applications per participant, the study simulated clinical routine. For ten days, one hand of the 29 test subjects was treated with Sterillium® classic pure 30 times per day. The second hand was not treated and served as control.

Skin hydration went up by an average of approximately 30%

The study shows: on all study days, the intensive application of Sterillium® classic pure resulted in a considerably improved skin hydration compared to the untreated hand. Already at the end of the first test week, the skin hydration had gone up by 30.39%. On the eighth day, the increase was even as high as 39.33%. At the same time, the participants reported that skin's dryness decreased considerably.

Increase in skin hydration compared to baseline in % (Corneometer data)

Sterillium®'s/Sterillium® classic pure's advantage in skin care

- Increased skin hydration
- Increased skin elasticity
- Intact skin barrier
- Reduced desquamation
- pH in the healthy range

The study on Sterillium®/Sterillium® classic pure clearly rectifies the prejudice that hand disinfectants dry the skin. An opportunity for enhanced compliance and skin health in patient care.

50 years ago, Sterillium® revolutionised hand disinfection. Today, Sterillium and Sterillium classic pure are used for routine, high-risk and outbreak situations. The hand disinfectants are characterised by a comprehensive spectrum of activity, good or very good skin compatibility and high user acceptance.
